

ABSTRACT

A method and system expedite delegation of at least one permission over a personal area network. Pregenerated values representing at least a portion of data required to create a digital signature are created on a computer. The values are transferred to a delegation device. The values are used in creating a digital signature on the delegation device. A delegator delegates to a delegatee the permission over the personal area network while physical presence exists between the delegator and the delegatee. The permission is represented using a digital signature and comprise authority to access services.
